

POWER cluster

Development of European Industry Research Projects

POWER cluster has offered opportunities for intense networking for both partners within the consortium and partners from organisations not directly involved in the project, and thus also for idea and project development and for sophisticated partner search for a range of offshore wind related funding streams.

Facilitating EU project development

A specific project activity has aimed at the facilitation of further project applications and cooperation in the framework of EU programmes, such as FP7, ERDF and Life Long Learning.

POWER cluster has developed an online "EU Project Development Facility" including an EU funding tracker. This tool is designed to give applicants hints and guidance on the different phases of the project development and application process.

Also the project has organised a number of transnational events, where representatives from academia and industry have had the oppor-

tunity to team up on ideas and start project development.

Main output and results

Some main achievements of our work include:

- a survey on offshore wind energy research activities in the POWER cluster countries,
- 3 transnational workshops bringing together industry representatives and researchers to define joint EU funded projects,
- an online "EU Project Development Facility".

Continued support

In order to maintain the strong market position of European companies on a global level, the POWER cluster partners will continue their support for R&D projects throughout the whole supply chain at the national and European level.
